Negative

NOTE:

- (A) A negative test result cannot exclude a recent infection.
(B) In early infection & some secondary infection, detectable level of IgM antibodies may be low. Some patient may not produce detectable level of antibody within the first 7-10 days after infection. Where symptoms persist, patient should be re-tested 3-4 days after the first specimen.
(C) The presence of detectable dengue virus NS1 antigen mean positive for early dengue infection. As with all diagnostic tests, all result must be considered with other clinical information available to the physician.
(D) Serological cross-reactivity across the Flavivirus group (dengue virus, St. Louis encephalitis, Japanese encephalitis, west Nile and yellow fever virus) is common.
(E) Test done by rapid immunochromatography method.

Test done from collected sample.
